

Installing the OpenConnect GP Client

1. From a terminal, lets add the PPA

```
sudo add-apt-repository ppa:yuezk/globalprotect-openconnect
```

2. Update your catalogs

```
sudo apt update
```

3. Install the client

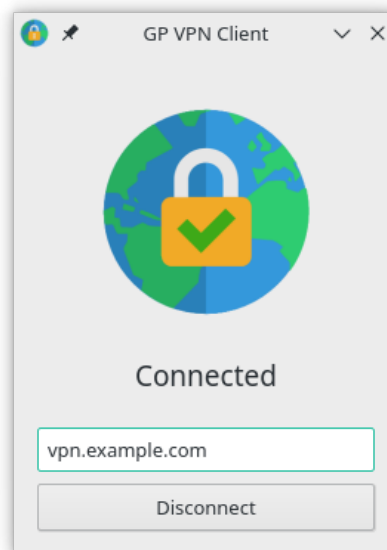

Ubuntu:

```
sudo apt-get install globalprotect-openconnect
```

4. If the client launches, close it and launch it from a terminal session instead. This part is important.

Run:

```
gpclient
```

5. Enter the portal address "**palovpn.holycross.edu**" and hit **Connect**.
6. In the terminal, you may get a prompt saying press Enter to continue however this will not work. Copy the key towards the end of the terminal.
7. Edit the gp.conf file to add the key

```
sudo vi /etc/gpservice/gp.conf
```

At the end of the document, add a new line

```
openconnect-args=--servercert <INSERT KEY COPIED>
```

8. Save and exit.
9. Launching the GP Client now from the terminal or GUI should now prompt for credentials. Provide your Google credentials to complete the process.
