MATH 133 - Calculus with Fundamentals 1
More on Indeterminate Forms and Algebraic Evaluation of Limits
October 6, 2015

## Background

Today we will work on more examples of algebraic methods to compute indeterminate form limits. You will need to recognize which algebraic methods apply and work through examples like these without the prompts from me for this week's problem set and quiz.

Questions
Compute the following limits:

$$
\begin{equation*}
\lim _{x \rightarrow 3} \frac{x^{2}-6 x+9}{x^{2}-5 x+6} \tag{1}
\end{equation*}
$$

(2)

$$
\lim _{t \rightarrow 0} \frac{3^{2 t}-1}{3^{t}-1}
$$

$$
\begin{equation*}
\lim _{x \rightarrow 3} \frac{x-3}{\sqrt{x}-\sqrt{6-x}} \tag{3}
\end{equation*}
$$

$$
\begin{equation*}
\lim _{x \rightarrow 0} \frac{\cot (x)}{\csc (x)} \tag{4}
\end{equation*}
$$

$$
\begin{equation*}
\lim _{x \rightarrow 2} \frac{\frac{1}{x^{3}}-\frac{1}{8}}{x-2} \tag{5}
\end{equation*}
$$

(6) The following one is called an $\infty-\infty$ form. Start by putting the terms over a common denominator. What kind of indeterminate form do you have now? Then try to apply one of the ideas we have discussed.

$$
\lim _{x \rightarrow-1}\left(\frac{1}{x+1}-\frac{2}{x^{2}+4 x+3}\right)
$$
