CHAPTER 1

Introduction

This handbook is directed mainly to authors preparing material for publication by the American Mathematical Society (AMS), using AMS-IFTEX document classes. As such, it deals with the AMS publishing style. Since these document classes are also used by authors who are not submitting items to the AMS, the handbook also covers topics of more general relevance. However, it assumes familiarity with standard IFTEX techniques and conventions, and contains only material specific to AMS packages.

The tagging of elements in a manuscript—title, author(s), section headings, theorems, etc.—is consistent through all AMS author packages, and the structure of elements in the body is based on that of the original LATEX document classes. Thus a manuscript prepared using an appropriate generic document class can be modified trivially to use a more specific AMS document class, simply by updating the \documentclass statement and making a few adjustments to the tagging of data in the top matter. For example, specify the *Graduate Studies in Mathematics* monograph series as follows: \documentclass{gsm-1}

Table 1. The AMS monograph series

Code	Full Series Name
cbms	CBMS Regional Conference Series in Mathematics (Monograph)
cmim	Clay Mathematics Monographs
coll	Colloquium Publications
crmm	CRM Monograph Series
gsm	Graduate Studies in Mathematics
hmath	History of Mathematics
surv	Mathematical Surveys and Monographs
mawrld	Mathematical World
amstext	Pure and Applied Undergraduate Texts
smf	SMF/AMS Texts and Monographs
stml	Student Mathematical Library
mmono	Translations of Mathematical Monographs
mmono-s	Translations of Mathematical Monographs (Iwanami Series)
ulect	University Lecture Series

The AMS-IATEX packages are available from:

www.ams.org/authors/monopackages

For more information, see Chapter 5.

A monograph is a long work by a single author or co-authors on a single subject. Each chapter should be prepared as a separate file, as should the bibliography. In addition, a "driver" file should be used to input all the others. These files should be given meaningful names, so that when they are transmitted to the AMS, there will be no question about which file represents which chapter. For example, a monograph by author Grey might be composed of files named grey.tex (the driver file), grey-ch1.tex, grey-ch2.tex, ..., grey-ch12.tex, grey-appa.tex, etc., and grey-bib.tex (or grey.bbl if BibTEX is used). If the author name is a common one, please include something to make it unique, such as first initials.

Information that identifies the author(s), the subject matter of the monograph, acknowledgments of support, and so forth, will appear in the front matter of the book. Place this information in the driver file, and use the tags shown in Table 2 in the *Top matter* section (page 11). This section provides explanations and an indication of which tags are required. Most of the tags used for the top matter of a monograph are the same as the tags associated with the top matter of an article.

This information will be provided to online bibliographic services for indexing.

CHAPTER 2

Using the monograph classes

1. The basic checklist

Some basic principles are important for effective handling of electronic submissions. Keep these principles in mind when preparing and submitting your files.

- Use the **template** supplied in the author package for your particular publication and the appropriate document class.
- Do not modify page sizes or other **dimensions**. Page sizes must conform to the specifications of the publication for which you are preparing your manuscript.
- Use only "public" packages available from CTAN (the Comprehensive TEX Archive Network).
- All of the AMS document classes incorporate the code for the AMS theorem (amsthm) package and automatically load the amsmath package. It is not necessary to request either one explicitly. Except for a brief overview of how to activate theorems (see page 11), the details will not be repeated here; see the user guides for these packages [ATH, AMG]. The amsfonts package is loaded as well, unless the [noamsfonts] option is specified; see the AMSFonts User's Guide [AFG] for the features provided.
- Do not redefine any existing LATEX or \mathcal{AMS} -LATEX commands.
- Put definitions for frequently occurring mathematical expressions together in the preamble, before the start of the text of the manuscript. Macros should be defined with \newcommand, not with \def. Once a macro is created for an expression, use it for every occurrence of that expression.
- Do not use **author-defined macros** in author names, titles, section and theorem headings, or references; use only standard commands. Do not hard-code font changes. Use TEX coding for special fonts (e.g., boldface or italic) only within the text of the manuscript.
- Avoid the use of math in the title and in chapter and section headings. **Titles** are provided to on-line bibliographic services for indexing. Use of TeX math coding (especially dollar signs) will result in inaccurate bibliographic listings, and problematic PDF bookmarks.
- Determine the **2010 Mathematics Subject Classification** numbers representing the primary and secondary subjects of the work. A list of these numbers can be found on the web at www.ams.org/msc.
- Make sure that **graphics** do not extend into the margins; the width of the text may vary depending on the book series. Check that all graphics conform to the AMS graphics guidelines—see Chapter 3, page 23.
- Do not use TEX coding to control **line and page breaks**. Lines and pages may break differently in the published book from the way they break in the file you submit. If you insert TEX coding for line and page breaks, it will have

to be removed for production. This work could offset any time saved by your keyboarding the manuscript, and any change to your TEX file creates a small chance of additional errors being introduced.

- Avoid explicit horizontal and vertical spacing commands for the same reason
- For displayed equations, the AMS style requires equation numbers to be on the left, flush with the left margin. See section 5.7, page 15.
- File names should not exceed 20 characters in length, and consist only of numeric or unaccented alphabetic characters. Avoid overly generic file names such as chap1.tex, mybib.tex or fig1.eps.
- Use \cite to indicate citations in the manuscript. The \cite command may not appear in an abstract.
- Include all available information for **references**; use the abbreviations for journals and book series from [ABMR], either in print or on the web.
- Include the research **address** or institutional affiliation and current address (if different) of each author. Email addresses and URLs may be included optionally. Email addresses will appear in books posted online; URLs will not; both will appear in print.
- **Proofread** your book thoroughly and carefully. Publications in some book series will not be given an editorial proofreading.
- **Verify** that author-submitted source files exactly match the accepted reference copy of the book.

2. A checklist for using AMS monograph classes

- Use a **driver file** and put the source code for each chapter in a separate file, using \include (not \input) to pull them together into a single document.
- The hyperref package will be added by AMS staff at the appropriate stage of the production process primarily for the purpose of adding PDF bookmarks. This will also affect internal cross-references and external URLs.
- Ordinarily, every chapter must begin on a new right-hand (odd-numbered) page.
- In **chapter titles**, the first and last words of the title and all nouns, pronouns, adjectives, adverbs, and verbs should be capitalized; articles, conjunctions, and prepositions should be lowercased except for the first and last words of the title.
- The running heads on the left-hand (even-numbered) pages should have the chapter title; the exact style will be taken care of by the class file. The title in running heads should be shortened only if necessary to fit on one line, leaving room for the page number. The running heads on the right-hand (odd-numbered) pages should have the section title (shortened if necessary) in the same style as the heading on left-hand pages. Uppercasing or other styling will be applied automatically if you are using AMS style files.
- Give information for **grants** or contracts under which the research was performed, including grant number, in the preface, along with other acknowledgments
- The following material must be provided for the **copyright page**, which will be prepared at the AMS: primary classification numbers according to the 2010

Mathematics Subject Classification scheme (www.ams.org/msc). For translations, include the name and city of the original publisher, the copyright year of the original publication, and the name and address of the translator.

• The title and copyright pages are for information only, so that a printed copy can be associated with the correct author(s). The final copy will be prepared at the AMS using the information you have provided.

3. The preamble

The area between the \documentclass statement and the line \begin{document} is referred to as the "preamble". This is the place to load external packages and define document-specific commands.

- **3.1.** Document class options. There are several \documentclass options authors might find useful. Some restrictions that may apply to particular journals or book series are not presented here in detail, but can be found in the author package instructions for those publications.
 - Paper size defaults to [letterpaper], and this is the size expected when files are submitted for publication. However, authors outside the U.S. may find [a4paper] useful for preparing drafts.
 - Two-sided or one-sided printing defaults to [twoside]. [oneside] might also be useful for drafts, but should be removed when files are submitted for publication.
 - Version can be specified as [draft] or [final]. The [draft] option causes overfull lines to be marked with a black slug in the right margin, calling attention to problems that should be corrected before submission. The default option is [final].
 - Font sizes can, for some publications, be selected as [10pt] (the usual default), [11pt] or [12pt]. Restrictions or alternate default sizes are given in the documentation for specific author packages.
 - Start on right- or left-hand page. For most book series, chapters start on a right-hand page, but occasionally (when chapters are very short), starting on a left-hand page may be desirable. The options [openright] (default) and [openany] control this arrangement.
 - Equation numbering defaults to the left, equivalent to [leqno]. Numbering on the right, with [reqno], is also supported, but is strongly discouraged because it is incompatible with the marking of theorem endings with a \qed box at the right margin.

For multiline equations, the equation number is by default centered vertically on the total height of the display (option [centertags]). To make the equation number print on the first line (for left-hand numbers) or the last line (for right-hand numbers), there is the option [tbtags] (top/bottom).

- Flush left displays can be specified by [fleqn]. With this option, displayed equations are aligned on the left instead of centered, with an indentation of \mathindent from the left margin.
- **3.2.** Packages. The AMS document classes incorporate the code for the AMS theorem (amsthm) package and automatically load the amsmath package. It is not necessary to request either one explicitly. The user guides for these packages [ATH, AMG] contain the details, which will not be repeated here, but see section 3.4 for

suggestions on setting up theorems. The amsfonts package is loaded as well, unless the [noamsfonts] option is specified; see the AMSFonts User's Guide [AFG] for the features provided.

Not all publicly available packages are compatible with the AMS document classes. For this reason, we mention some that are:

- amssymb provides names for additional symbols from the AMS symbol fonts; see [AFG] for details.
- amsmidx supports multiple indexes for a book; an alternative package, imakeidx, may also be used, with some restrictions; see page 16.
- amsbooka provides the ability to specify a different or additional author for an individual chapter or appendix, and have that information automatically included in the TOC in an appropriate format.
- graphicx is part of the LATEX suite, preferred for inclusion of graphics.
- longtable facilitates tables longer than one page.
- mathtools provides some display math enhancements that weren't anticipated when amsmath was developed.
- natbib supports author-year referencing, appropriate for historical and expository works, when used with BibTFX. amsrefs has a comparable facility.
- upref forces cross-references with \ref to roman (upright); see "Roman type", page 15.
- tikz is recommended for creating charts and other graphics, including commutative diagrams.
- xypic is also recommended for creating commutative diagrams.

Some of these recommendations are noted in the templates that are included in every author package.

There are several packages that cause particular problems for AMS production. Their use should be avoided:

- geometry changes page dimensions even if no explicit changes are specified by the author.
- epsfig has been superseded by graphicx.
- diagrams, by Paul Taylor, contains a "time bomb" that renders it inappropriate for a production environment.
- parskip redefines the processing of tables of contents, as well as making other format changes that do not follow AMS guidelines.

Don't load any packages that aren't actually needed.

3.3. New commands. Place all definitions for new commands in the preamble. This includes instructions to access fonts that are not already defined in the AMS document classes or amsmath, such as a new math alphabet (see [AMG]).

Always use \newcommand; this will let you know if the name you have chosen has already been used. Do not redefine any command from LATEX, amsmath, or any AMS document class, as this could cause problems in AMS production. New definitions may be used to provide shorthand forms for mathematical expressions that are used frequently, but do not use new definitions for text; for books posted online, this will prevent indexing software from identifying relevant references.

Use commands and environments provided by the AMS document classes and standard packages whenever applicable—for example, you should use the AMS proof environment rather than defining your own alternative.

When the file is complete, remove any commands that haven't been used.

3.4. Theorem declarations. Comprehensive theorem facilities are provided by the inclusion of the amsthm code in the AMS document classes, but to use them, the particular theorem types must be activated in the preamble. A theorem "type" consists of two parts: a \theoremstyle and a \newtheorem statement. Three predefined theorem styles are provided: plain (default) adds extra space above and below, and sets the text in italic; definition adds space above and below, but sets the text in upright type; remark has no extra space above or below, and sets the text in upright type. Suggested associations for theorem types and theorem styles are given in the amsthm documentation [ATH].

To declare the theorem types to be used, list the declarations below the appropriate \theoremstyle line, as follows:

- \newtheorem{thm}{Theorem} will set up an environment thm that will be numbered consecutively throughout the entire document. To number theorems within sections, specify this as \newtheorem{thm}{Theorem}[section].
- To number a different theorem type consecutively with ordinary theorems, declare it as \newtheorem{lem}[thm]{Lemma}. This works with any other element with a defined counter; substitute the desired counter for [thm]. For example, authors wishing to number theorem-class objects consecutively with equations can specify \newtheorem{thm}[equation]{Theorem} and thereafter use [thm] as the reference counter.
- The two "reference" counters can be thought of this way:
 - $\newtheorem{\langle environment \rangle}{\langle Heading \rangle}[\langle number-within \rangle]$
 - $\text{\ } \{ (environment) \} [(reference-counter)] \{ (Heading) \}$

4. Top matter

The top matter associated with a book includes information that would appear in a bibliographic reference to the book, plus additional information about the author(s), subject classifications, and acknowledgments of support.

- **4.1. Summary of tags and elements.** Table 2 lists the top matter commands provided by $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ -IATEX version 2.0 and later. Not every tag is necessary for each book. The table shows which tags are required and which are optional. The template file included in every author package contains all the necessary tags and instructions for using them.
- **4.2. Title.** The book **\title** is only for the purpose of identification during production. The actual title page will be created independently from information provided separately with the submitted files. Do capitalize all proper names. The title should be input in a style appropriate for use in a bibliography; the style of the title that will appear in print for the particular publication will be generated automatically when the book is processed at the AMS.

A multiline title may be left for LATEX to break, or a desired break may be indicated by \\.

4.3. Author information. Enter the name(s) of the author(s) with the tag \author, using standard capitalization for proper names. Use a separate \author command for each author. Names will be combined by IATEX according to the dictates of the document class. See also "contributors", below.

Table 2. Top matter tags for monographs

$required^1$
$required^1$
if needed
required
optional
optional
optional
$optional^2$
(not used)
optional
3
required
optional
optional
required

¹ If no short form is needed, omit the bracketed option.

For each author you should provide one or more addresses. Tag them as follows, grouping them in this order by author:

- \address{...} address where the research was carried out (required)
- \curraddr{...} current address, if different from the research address (optional)
- \email{...} address for electronic mail (optional)
- \urladdr{...} URL address (optional)

Do *not* include any addresses within the scope of an **\author{}** command (this is different from basic LATEX document classes). Do not use abbreviations in addresses.

Addresses are considered part of the top matter. Suitable labels will indicate the current, email, and URL addresses, typically *Current address*:, *E-mail address*:, *URL*:, respectively.

If a tilde ($\tilde{}$) is needed in a URL address, enter it directly as $\tilde{}$ if you are using $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ -IATEX version 2.20 or later; otherwise, see the Author FAQ [FAQ] for instructions.

4.4. Contributors (new with version 2.20). Contributors are much like authors, but are responsible for only a portion of a document, e.g., an appendix or auxiliary tables. The bracketed portion is not optional; it gives the exact text that will be printed to indicate the nature of the contribution:

```
\contrib[with an appendix by]{William Rogers}
```

Multiple contributors and contributions are input like this:

```
\contrib[with Appendix A by]{William Rogers}
\contrib[]{Henry Taylor}
\contrib[and Appendix B by]{John Henderson}
```

² For monographs, a separate dedication page is preferable; see instructions below.

³ If this is necessary, it will be filled in by the AMS staff.

Note the empty brackets on the second line. Multiple contributors indicated in this way will be combined with "and" added where appropriate. Addresses provided for contributors will be treated the same as for regular authors.

- **4.5. Dedication.** The dedication for a monograph is set on a separate page. The template provided in the author package includes instructions for formatting this page.
- **4.6.** Acknowledgments of support. Information concerning grants and other kinds of support as well as personal acknowledgments are usually included in the preface of a monograph.
- **4.7. Subject information.** Subject classifications and key words, like titles and author names, are part of the top matter.

Subject classifications may be primary (the major topic(s) of the book) or secondary (subject areas covered by ancillary results, motivation or origin of problems discussed, intended or potential field of application, or other significant aspects worthy of notice). At least one primary subject classification is **required**. Additional primaries and secondaries are optional.

These classifications are entered as

\subjclass[2010]{Primary \(\rho \primary \class\rangle;\)

Secondary $\langle secondary \ classes \rangle \}$

separated by commas within. Omitting [2010] will cause the 1991 Subject Classification to be cited; if an error for 2010 is reported, your version of the AMS document classes is from before 2009 and should be upgraded.

To determine the classifications, use the 2010 Mathematics Subject Classification scheme, which can be accessed on the Web at www.ams.org/msc. Please use the full number; the two-digit code from the Contents of *Mathematical Reviews* is **not** sufficient.

Key words are not required but may be provided by an author if desired. They should be entered as \keywords{...}, separated by commas, with only the first word and proper nouns capitalized.

4.8. Abstract. A monograph does not require an abstract, but one may be provided if desired. If provided, it may be used in creating text for the back cover of a softcover volume.

Input the abstract text between \begin{abstract}...\end{abstract}. It may comprise multiple paragraphs and include unnumbered display material if appropriate. The length of the abstract depends primarily on the length of the book itself and on the difficulty of summarizing the material. An upper limit of about 300 words is suggested. Do not use author-defined macros, \cite, or \ref in the abstract.

5. Document body

5.1. Linking for the Web. Any new monograph may potentially be posted online. Electronic manuscripts prepared in IATEX for any new book should be tagged for maximum linking on the Web. For use of \label, \ref, and \cite, see [MG]; for \eqref, see [AMG]. The hyperref package will be added by AMS staff at the appropriate stage of the production process and will be applied to internal cross-references and external URLs.

5.2. Headings. Six levels of headings are provided to permit logical sectioning of a manuscript.

```
\part[...]{...}
\chapter[...]{...}
\specialsection{...}
\section[...]{...}
\subsection{...}
```

\part is the highest level, and is ordinarily used only when distinct portions of the manuscript have significantly different types of content, are directed toward different audiences, or are intended to be addressed at different times, e.g., as for different semesters in a multi-semester course.

The \chapter division is provided only for monographs.

In chapter titles, the first and last words of the title and all nouns, pronouns, adjectives, adverbs, and verbs should be capitalized. Articles, conjunctions, and prepositions should be lowercased unless they are the first or last word of the title or the first word after a colon (:).

A multiline title may be left for LATEX to break, or a desired break may be indicated by \\. Unless the chapter title is very short, provide an alternate form suitable for use in running heads. This should be entered in brackets between the tag \chapter and the full title: \title[\short title]] {\short title}]. Unlike the practice in the basic LATEX document classes, the optional alternate form is not the form used for the TOC; instead, the full form of the title is used there.

Starred heading commands (\chapter* and \section*) do not provide for a bracketed short form; if a short form is needed for running heads, use

```
\label{lambda} $$ \mathbf{\langle} \operatorname{short\ chapter\ title} \leq (\operatorname{short\ chapter\ title}) $$ \operatorname{markright} (\operatorname{short\ section\ heading}) $$
```

typing the heading text in all uppercase if that is the style of the running heads for the relevant series.

Do not use author-defined macros in the title.

If \\ has been used to break a chapter title, an adjustment must usually be made for the table of contents. This can be done by specifying what is to be included or omitted from the TOC as follows.

- \except{toc}{...} excludes material from the TOC, for example \chapter{some text\except{toc}{\\} the rest of the title}
- \for\{\tau_i\} inserts an additional directive in the TOC, often an alternate linebreak command.

\specialsection differs from \section mainly in the formatting of the heading. A \specialsection heading will not be used as a running head.

Any heading may be given a label to allow references to be made to it, by including a \label{...} command with a unique identifier directly *after* the heading. References are made using the command \ref{...} and the same identifier. For example,

```
\section{Historical note}
\label{s:hnote}
```

will establish a label for this section that can be referred to with \ref{s:hnote}. Cross references of this sort will require LATEX to be run at least twice for proper

resolution. A warning at the end of the LATEX run, "Cross references may have changed...", should be heeded in this regard.

- **5.3.** Mathematical text. For instructions on preparing mathematical text, refer to [AMG] and [Gr]. See also "Roman type", below.
- **5.4.** Lists. Follow usual LATEX conventions for producing list environments.
- **5.5.** Theorems, lemmas, and other proclamations. See the manual *Using the amsthm package* [ATH] for details. Theorem environments following AMS style with respect to punctuation, spacing, and paragraphing are defined in the AMS document classes. This is incompatible with the LATEX theorem package, which cannot be used with the AMS document classes.

Three different theorem styles are provided by AMS document classes: plain, definition, and remark. By referring to these styles and using the \newtheorem command, you can build a complement of theorem environments appropriate for any paper or monograph. All \newtheorem specifications should be included in the preamble; a starter set is included in the template for every AMS author package.

Theorem support is also available separately in the amsthm package for users of document classes other than those from the AMS.

- **5.6.** Equations. Check displayed equations carefully, making sure they are broken and aligned following the guidelines in [Sw, pp. 38–41], and that they do not exceed the width of the page for the publication in which they are to appear. For multi-line displays, use the structures defined in the amsmath user's guide [AMG].
- 5.7. Equation numbering. AMS style (and the default behavior) for display numbers is always to place them at the left margin, so that they are always in a predictable location, and thus easily found. Left placement ensures that they don't interfere with the qed box on proofs, or other similar flags. Please note that the use of any other numbering style will be changed to accord with standard AMS practice, which may run the risk of introducing inadvertent errors. If you have any questions about this, please contact AMS technical support; see page 31.
- **5.8. Roman type.** Numbers, punctuation, (parentheses), [brackets], {braces}, and symbols used as labels should ideally be set in roman (upright) type. This is true even within the statement of a theorem, which is ordinarily set in italic type.

Be careful to distinguish between roman elements that are mathematical in nature (e.g., "a group of class 2"), and those that are part of the text (e.g., a label or a year). Mathematical expressions, no matter how short or insignificant, should be coded as math, by enclosing them within dollar signs \$...\$ or \(\ldots\ldots\rdots\rdots\ldots\rdots

Abbreviated forms of mathematical terms are also usually set in roman type to distinguish them from mathematical variables or constants. Use the control sequences for common mathematical functions and operators like log and lim; use \DeclareMathOperator to add additional operator names (see [AMG, §5]).

The style of reference citations, though publication-dependent, is usually roman. To ensure consistency and support linking for the Web, always use the

standard IATEX \cite command when citing a reference (alternate forms of the \cite command are provided by natbib if that package is used for bibliographies in author-year style). Internal references with the \ref command are not automatically roman in non-roman environments, but can be forced by using the upref package (part of the AMS-IATEX collection). The command \eqref, to be used for references to numbered equations, includes parentheses along with the equation number, all in roman type, e.g., \eqref{eqn2.4} will produce "(2.4)" (assuming that is the correct label for that equation).

5.9. Exercises. The xca environment is encouraged for producing exercises that appear individually within a section. This environment is defined in the document preamble with \theoremstyle{definition} and the \newtheorem command; it is used in a manner similar to that of any other theorem-class environment.

The xcb environment is defined only for monographs and is used for exercises that occur at the end of a chapter. The environment is presented as a section, with special formatting in some book series. In this environment, exercises are usually presented as an enumerated list, with each exercise introduced by \item. Some detailed suggestions for working within this environment are given in the Author FAQ [FAQ].

5.10. Indexing. Ideally, index terms should be included directly in the TEX file(s) for the document, to ensure correct page references. The output resulting from TEXing the file should conform to the rules of *MakeIndex*. Output of this program is processable only by LATEX. All indexing methods described here require that the *MakeIndex* program be run separately from the LATEX run, and that LATEX then be rerun to incorporate the actual index(es).

The tags needed for \makeindex are already included in AMS document classes. Do not include the makeidx package, but do put the command \makeindex in the preamble to launch a single index, and \printindex where you would like the index to appear. See [MG, chapter 11] and [KD, chapter 11] for use of \makeindex.

Answers to some common questions about indexes are given in the AMS Author FAQ [FAQ].

If more than one index is desired, two packages are available that are compatible with AMS document classes.

amsmidx. A package written at AMS, amsmidx, is included in the $\mathcal{A}_{\mathcal{M}}S$ -IATEX collection beginning with version 2.20. Unlike most other multiple-index packages, amsmidx is compatible with the AMS document classes. To use this package, put these commands into the preamble:

```
\usepackage{amsmidx}
\makeindex{\(\lambda\) ame of first index file\)}
\usepackage{amsmidx}
\usepackage{\(\lambda\) ame of first index file\)}
\usepackage{\(\lambda\) ame of second index file\)}
\usepackage{\(\lambda\) ame of second index file\)}{\(\lambda\) ame of index file\)}{\(\lambda\) index\(\lambda\) ame of first index file\)}{\(\lambda\) index\(\lambda\)}
\usepackage{\(\lambda\) ame of index file\)}{\(\lambda\) index\(\lambda\)}
\usepackage{\(\lambda\) index\(\lambda\) index\(\lambda\)}
```

imakeidx. The package imakeidx follows "normal" IATEX style for specifying options, unlike amsmidx; however, it didn't exist when the latter was written. With imakeidx, no file name need be given for the main index; the name of any additional index is specified as an option. Specify the indexes in the preamble like this:

```
\usepackage[original]{imakeidx} \underset makeindex % will get the same name as the main file \underset makeindex[\langle name\ of\ second\ index\ file \rangle]
```

The [original] option is required to preserve the correct AMS-publication-specific formatting of the first index page.

To identify an entry for the main index in the text:

6. Floating objects: Figures and tables

Figures and tables are usually handled as floating inserts. Such items are often so large that fitting them into the document at the point of reference may cause problems with pagination. Placing such items into a floating insert allows them to be repositioned automatically by LATEX as required for good pagination.

A floating insert generally contains one of these possibilities:

- LATEX code that produces an object such as a table or commutative diagram;
- a command to incorporate an item produced by another application (most often an Encapsulated PostScript (EPS) file produced by a graphics utility; see *Graphics*, page 23).

If a figure is described by LATEX code (e.g., using xypic, tikz, or the picture environment), it should be included directly in the file.

6.1. Placement. Floats should

- (1) be numbered consistently throughout the paper (figures and tables are numbered separately),
- (2) be placed at the top or bottom of the page,
- (3) have an in-text reference, and
- (4) definitely appear within the same section as their first text reference.

A figure or table should not precede its first text reference unless they both appear on the same page spread. When a figure or table is an integral part of text, it may appear unnumbered in place in the middle of text.

Figures and tables should be allowed to float according to the LATEX defaults preset by the document class. If you are submitting a file that will be processed at the AMS, you could introduce major problems with pagination if you hard-set your figures and tables by using the [h!] option. Production problems will be avoided when you use the appropriate author package class file and avoid using figure or table options. For electronic manuscripts, the final placement of inserts will be determined by the AMS production staff, on the basis of the most appropriate page layout.

6.2. Captions. Captions for floating inserts are usually positioned above a table and below a figure. The following is the general structure used to specify a figure insert, with a caption at the bottom:

```
\begin{figure}
\includegraphics{\( file name of .eps file \) \}
    or \( \langle code for the insertion \rangle \)
\caption{\( \langle caption text \) \}
\langle label{\( \langle reference label \) \}

This is the general structure for a table insert, with a caption at the top:
\begin{table}
\caption{\( \langle caption text \) \}
\label{\( \langle reference label \) \}
\( \langle \)
\( \langle \langle \langle reference label \) \}
\( \langle \)
\( \langle \langle \langle \langle reference label \) \}
\( \langle \)
\( \langle \lang
```

 $\caption{\langle caption\ text\rangle} \\ \label{\langle reference\ label\rangle} \\ \langle code\ for\ the\ insertion\ body\rangle \\ \caption{\langle code\ for\ the\ insertion\ body\rangle} \\ \caption{\langle code\ for\ the\ insertion\ body} \\ \caption{\langle code\ for\ the\ insertion\ bo$

Caption headings (e.g., "Table 3.1." or "Figure 7.") will be supplied automatically. The $\langle caption\ text \rangle$ is any appropriate descriptive text, and may be omitted if no descriptive text is desired. (The style of the caption differs from the basic LaTeX caption style.) A reference label should usually be associated with the caption, and must be given after the caption. A reference in text to the figure or table has the form $\mathbf{ref}\{\langle reference\ label \rangle\}$.

LATEX packages for captions may appear to work with the AMS document classes, but the caption style usually doesn't match the AMS style.

6.3. Centering tables and figures. All AMS classes center the content of table and figure environments. Using \centering or \begin{center} and \end{center}, therefore, is unnecessary. For example,

```
\begin{table}
\caption{This is a table}
\begin{tabular}{cccc}
1&2&3&4\\
5&6&7&8\\
9&10&11&12
\end{tabular}
\end{table}
causes this to be typeset
```

Table 3. This is a table

1 2 3 4 5 6 7 8 9 10 11 12

7. Bibliographic references

Bibliographies may be prepared using either amsrefs or BibTEX.

7.1. Using BibT_EX to prepare a bibliography. An author may find it convenient to maintain a file of references in BibT_EX form, as described in *The LATEX Companion* [MG, Section 13.2]. Two BibT_EX styles are provided:

```
amsplain.bst will produce numeric labels; preferred for articles;
amsalpha.bst will produce labels constructed from the author name(s)
and year of publication.
```

Both will translate references in a BibTeX input (.bib) file to LaTeX input in a .bb1 file in the form appropriate for AMS publications, including all necessary formatting instructions. This method of preparing bibliographies is therefore recommended.

To access a BibTEX bibliography in a monograph, include these instructions in the appropriate place in the input file:

```
\bibliographystyle{\langle style \rangle} (amsplain or amsalpha) \bibliography{\langle name\ of\ bibliography\ .bib\ file \rangle}
```

Running BibTeX on the .bib file will produce a .bbl file. The .bib file may have any name the author finds convenient; however, the .bbl file must have the same name as the source file from which it is input, so it may be necessary for the author to rename it. If a chapter has a separate bibliography, after the bibliography has been completed (including processing by BibTeX), the contents of the .bbl file should be inserted into the chapter input file, replacing the \bibliographystyle and \bibliography statements.

Items in the bibliography are usually ordered alphabetically by author. BibTEX processing may alter this order, especially if the amsalpha style is used.

All categories of bibliographic entries listed in [MG, Table 13.1] are supported in the two AMS BibTeX styles. In addition to the fields listed in Table 13.1, a language field is provided in the AMS styles for use in identifying the original language of an item whose title has been translated.

The natbib package (available from CTAN or present in distributions based on TEX Live) provides an author-year style that is compatible with the AMS document classes. This should ordinarily be used only for monographs on historical topics.

Standard abbreviations for periodicals should be obtained from [ABMR].

7.2. Using amsrefs to prepare a bibliography. amsrefs is a LATEX package for preparing bibliography or reference lists. It attempts to provide many of the convenient features that LATEX and BibTEX users have come to expect without imposing all of the overhead that BibTEX entails. In particular, it has been carefully designed to encourage the preservation of structured markup of the bibliography throughout the entire lifetime of a document from rough draft to final archival version. It does this by replacing LATEX's unstructured .bb1 file format by a new, fully structured format. The package is compatible with the showkeys, hyperref, and backrefs packages and implements the functionality of the popular cite package. Interoperability with BibTEX is supported via a special bibliography style file, but amsrefs can be used without BibTEX. Full documentation of the amsrefs package can be found in [AMSR].

¹Note that unlike most packages, which must be loaded *before* hyperref, the amsrefs package must be loaded *after* hyperref in order to work properly.

- 7.2.1. Using the amsrefs package. There are three ways of using the amsrefs package:
 - (1) Enter bibliography items directly in your LATEX document using the biblist environment and the \bib command.
 - (2) Import items from an external .1tb file.
 - (3) Import items from a .bib file using BibTEX and the special bibliography styles distributed with the amsrefs package.
- 7.2.2. Using the amsrefs package with $BibT_{E\!\!\!/}X$. Finally, you can use amsrefs in conjunction with $BibT_{E\!\!\!/}X$:

```
\documentclass{...}
\usepackage{amsrefs}
\begin{document}

Alan Sokal~\cite{Sokal96} recommends Bourbaki's
text~\cite{Bourbaki70} for a gentle introduction to set theory.
\bibliography{nonsense}
\end{document}
```

Note two things:

- Unlike when you use \bibselect to import entries from a .ltb, in this case the .bbl will contain the bibdiv and biblist environments.
- There is no need for a \bibliographystyle command. In fact, any \bibliographystyle command you put in your document will be ignored. amsrefs will automatically invoke the correct style.

The main advantages of using BibT_FX are:

- you can take advantage of BibTFX's ability to sort your items for you, and
- you can take advantage of the large number of BibTEX database files already in existence.

As when using an .1tb file, you may wish to replace the \bibliography command by the contents of the .bbl file when you have finished compiling your bibliography.

7.3. Preparing a bibliography without BibTEX. The references section of a paper is contained between the commands

```
\label{label} $$ \left( model\ label \right) \in \{ model\ label \} $$ \end{the bibliography} $$
```

This environment resolves to an unnumbered chapter in a monograph, following AMS publication specifications. The indentation for the labels is set to an appropriate width using the model given with the \begin command. Thus the widest label in the bibliography should be used as the model; for example, 99 will provide space for a 2-digit numeric label.

For the proper order of reference elements and use of fonts and punctuation, look at a volume in the book series for which your document is intended and follow the examples you see there. More examples are given in [Sw].

Reference input. Begin each item with the command $\bibitem{\langle bibitem \ label \rangle}$. The LATEX default is to number references automatically; however, other labels may be used by inserting an optional key argument in square brackets between the command and the internal label:

\bibitem[ABC]{Arno1994}

The item label and the key need not be identical. Whatever appears within the [] is what prints; whatever is within the curly braces is used for linking and must not include any math or special characters.

Give at least one full name; initials and last name is an acceptable form. If a subsequent reference is by the same author(s), use $\$ instead of the name(s). For examples, refer to [Sw].

8. Permissions

Authors must obtain permission for the use of any material, including graphics, photographs, and text, appearing in their Work which comes from *any* other source. Authors should use the Society's Permission Form to request permission from an author or publisher for material previously published or owned by another. Permissions must be obtained for both print and electronic rights for all editions (present and future) and must be free of any restrictions which may limit the AMS's ability for itself or through licensees to produce, publish, promote, and distribute the Work in any territory, any language, and any medium now known or hereafter discovered. If you are applying for permission using a publisher's on-line form, please match the AMS's requirements as closely as possible. Any permissions that include restrictions will likely result in the material being omitted from the Work.

Additional help is available from the AMS Acquisitions Department:

Acquisitions Department American Mathematical Society 201 Charles Street Providence, RI 02904-2294 USA Email: acquisitions@ams.org

Written permission for use of material in both print and electronic media should be sent to the AMS along with the final manuscript.

Information about copyright and permissions is available on the Copyright and Permission Information page at www.ams.org/jourhtml-copyright-info.

CHAPTER 3

Graphics

1. Getting started

Please take a moment to review the material in this chapter. Problems with graphics in production can lead to significant delays in processing and publishing your work. Graphics are critically important in conveying large amounts of complex information and by observing a few relatively simple guidelines, you can assist in the efficiency of the publishing process.

- Use a standard T_EX graphics inclusion macro package. The recommended graphics inclusion package for I^AT_EX 2_€ is graphicx. Be sure that commands used to include graphics in T_EX are compatible with Radical Eye Software's dvips.
- Do not place graphics for use in TEX files in subdirectories.
- Number figures consistently throughout the paper.
- Use an in-text reference.
- Set figure captions in T_EX.
- Set figure captions below the figure.
- Make sure figures are sized correctly and do not extend into the margins of the paper.

2. File format

The preferred file format for graphics is EPS (Encapsulated PostScript). Other formats will be converted to EPS at the AMS.

3. Resolution requirements for bitmap graphics

Line art: 600 pixels per inch (PPI) at 100%.

Halftone: 300 PPI at 100%.

Combination halftone: 600 PPI at 100%.

4. Size of graphics

Create graphics at 100% of the size at which they will be printed.

• If the figure is too large, resize the figure in a graphic program, not in T_FX.

5. Naming files

File names should be no longer than 20 alphanumeric characters. Do not use accented alphabetic characters. Avoid overly generic file names such as fig01.eps.

6. Placing graphics in your paper

Use a standard TEX graphics inclusion macro package. We recommend graphicx.

7. Lines and rules

Do not use a line/rule weight less than half a point (.5 point) at 100%.

- If you must scale your figure, be sure that you compensate by making line weights thicker. A .5 point line scaled at 50% becomes a .25 point line. Lines with weights less than half a point may disappear during the printing process.
- Increase graded lines in half-point increments (i.e., .5 point, 1 point, 1.5 points). Otherwise, the lines will not appear as distinctly different lines.
- Give lines that are a shade of gray (screened) or colored a line weight of at least 1 point at 100%. Gray and colored lines with weights less than 1 point look broken and jagged because of the small dot pattern used to simulate a shade of gray or color tone.

8. Shades of gray (screens)

Screens (a pattern of small black and white dots used to simulate shades of gray) should not be lower than 10% or higher than 85%.

- \bullet Screens outside the range 10% to 85% are either too light or too dark to print correctly.
- Screen density should increase in increments of no less than 10%. Screen variations of less than 10% are not distinguishable.
- Do not put (black or colored) type on a screen darker than 35%. Type on a screen that is above 35% is not legible.
- White type can be used only on 100% black. White type on a gray background looks broken and jagged because a small dot pattern is used to simulate shades of gray.

9. Font usage

Fonts should be fully embedded in your graphics.

- Whenever possible, fonts used in graphics should match those used in text.
- Fonts should be fully embedded in your graphics. If the fonts are not embedded in a graphic, it is possible that the font will be replaced with a default font such as Courier and the characters will not print properly. If you are unable to embed the fonts in your graphic, convert the fonts to paths (or outlines) prior to exporting the file to EPS. The fonts can be converted in the program you used to create the graphics. (For assistance, consult your graphics program's documentation.)
- Use Type 1 outline fonts instead of bitmap fonts. Type 1 outline fonts are vector based. These fonts do not lose quality when they are output to high-resolution printers.
- Do not subset fonts included in your graphics. It is imperative that the full font set be included in every graphic. If only a subset of a font is included, a font error can occur, which may cause characters to disappear in both the graphic and the DVI file.
- Avoid using fonts with city names such as Chicago, Monaco, Geneva, etc.

10. Multiple-part figures

Multiple-part figures should be configured as one figure in a graphics program, not in T_{FX} .

• Aligning multiple-part figures is very difficult in TEX. It is easier and more cost-effective to do so in a graphics program.

11. Cropping and bounding boxes

Do not crop by pasting areas of white over portions of the graphic.

- When using a smaller area of a larger graphic, clip or crop within the graphics application to delete all but the desired portion.
- Do not crop by pasting areas of white over portions of the graphic. Doing this will make the bounding box larger than it should be and will cause problems when the graphic is included in TeX.
- If possible, verify that bounding box information is correct. If the bounding box is not correct, graphics might be clipped off in unexpected ways.

12. Color graphics

12.1. Color spaces and gamuts. There are two main color spaces in use: RGB (Red-Green-Blue) and CMYK (Cyan-Magenta-Yellow-Black). The former is used for light-emitting displays (computer monitors, for instance) while the latter is used for printing.

One of the characteristics of a color space, such as RGB or CMYK, is its gamut, the range of colors that it can reproduce. The RGB color space has a much larger color gamut than the CMYK color space, as shown in Figure 1 (page 26, left). Colors in the RGB color space that lie outside the gamut of the CMYK color space must be approximated by the CMYK color space, with varying degrees of success: Figure 1 (page 26, right) compares the color output from various color technologies. CMYK colors can generally appear more muted when compared to their RGB counterparts. All RGB color graphics have to be converted to CMYK for printing. All color graphics, both RGB and CMYK, are subjected to analysis here at the AMS and optimized for printed publication.

Above all, bear in mind that color graphics viewed on a monitor or printed on a personal printer will not necessarily be an accurate rendering of how colors will look when printed on a press. Our Graphic Arts group has years of experience in bringing out the best from a wide variety of graphics, particularly color graphics.

- 12.2. Requirements for graphics to be published in color. Graphics intended to be printed in color should be submitted in CMYK format. If you submit RGB files they will be converted to CMYK. The AMS cannot guarantee that color reproduction in the print product will match the RGB file.
- 12.3. Color graphics to be printed in black and white or grayscale should be converted to black and white or grayscale before being submitted to the AMS. When color graphics are printed in black and white or grayscale, sometimes lighter colors, such as yellow, disappear, or darker colors, such as red and blue, appear to be the same tone. It is preferable that you convert your color graphics to grayscale and check to be sure that all the elements in your graphics

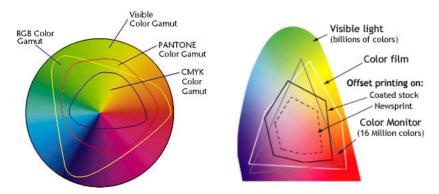

FIGURE 1. Left: A comparison of the colors available in various color spaces. Right: A comparison of the colors available with various display technologies.

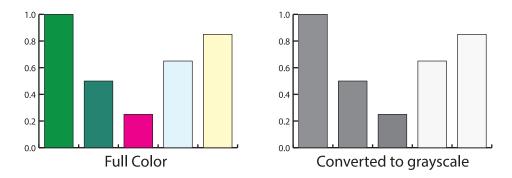

FIGURE 2. Colors don't always have the intended effect when converted to grayscale.

print as desired—see Figure 2, above. Check your color figures on a black and white printer to ensure that the black and white printout of your figure is legible.

- 12.4. Shades of colors. Inherently light colors should be handled carefully when using shades of them. Whereas 50% red turns out to be a usable pink, a 50% yellow or cyan may be almost invisible.
- 12.5. Colored lines should be no less than .5 point in width. Colored lines in inherently light colors (e.g. yellow and cyan) should always be at or near 100% in tint.

13. Using type in graphics

Type within graphics requires special attention to reproduce legibly.

- Basic type size should be no less than 10 point at 100%. For graphics intended for viewing online, although 10-point type is acceptable for print, screen resolution is 72 PPI and 10-point type will be difficult to read online.
- Do not put type on a dark background. Dark type on dark colors is not legible.

• Check your color figures on a black and white printer to ensure that the black and white printout of your figure is legible.

14. Tables

Tables can be thought of as a special kind of graphic. They often require a great deal of attention to make them effective.

- Make sure that the width of the table does not exceed the width of the text block.
- Very wide tables can be rotated using the rotating package together with the sidewaystable environment. Remember that tables (and figures) should be rotated such that the left-hand side of the table (or figure), after rotation, is at the bottom of the page.
- Set table captions above the table.
- For more help on the formatting of tables, see [MG, chapter 5] and [tbl-voss].

15. Photographs

Photographs must be at a minimum resolution of 300 dpi at the actual size that the photograph will be printed in the published product.

- Photographs should be at least 300 dpi in resolution at the actual size that the photograph will be printed in the published product. Do not scale photographs in T_FX.
- File format can be EPS, TIFF, or JPEG.
- Color photographs must be saved in CMYK format. (See Color Graphics, section 12.)

16. T_EX graphics

There are several ways of providing graphics by the use of TEX coding, the principal choices being

tikz: Based on the PGF (portable graphics format), this is a very flexible environment for creating graphics within a TEX document. Note that it functions equally well in dvips-based LATEX and pdfLATEX as well as the newer varieties of TEX such as XELATEX and LualLATEX. The native documentation [tkz] is excellent, though massive. There are two very good primers by Mertz and Slough: [ttkz] and [ptkz]. A large set of examples, often generously documented, can be found at [tkz-ex].

pstricks: Also a very flexible and useful environment for drawing in T_EX. It is most easily used with dvips-based T_EX, though, with some care, it can be used with pdfI^AT_EX. There is an excellent new reference book by Herbert Voss, PSTricks: Graphics and PostScript for T_EX and I^AT_EX [pst-voss]. The use of pstricks is also covered in some detail in [GM, chapters five and six].

xy and xypic: Though generally associated with commutative diagrams, these packages can also serve as a general drawing environment for TeX.

A great deal of general information about other \LaTeX graphics packages can be found in $[\mathbf{GM}]$.

CHAPTER 4

Submitting files to the AMS

1. Submission guidelines

Upon acceptance of your book, the source file(s) should be sent to the AMS office (this includes the TEX source file(s) and any graphics files). Send only the files that are needed to process your submission or archive it for future reference.

Before sending the source file(s), be sure you have proofread your monograph carefully. The files that you send must be the EXACT files used to generate the proof copy that was accepted for publication. In order to avoid any possible production problems, before sending the files, be sure to verify all items in the sections *The basic checklist* (page 7) and *A checklist for using AMS monograph classes* (page 8).

If your submission consists of **multiple files**, we recommend that you bundle them using the Zip utility; this can be obtained (free) for most platforms from freecode.com. Bundling means that only one (compressed) file needs to be sent, lessening the chance of name conflicts or file corruption.

2. Web server submissions (preferred)

Accepted electronic manuscripts can be submitted via the web server at .www.ams.org/submit-book-journal. For security and confidentiality reasons, submitting through the web server requires an AMS web account. Authors who do not already have an account will be given the opportunity to create one as they go through the submission process.

3. Electronic mail submissions

Files sent by electronic mail should be addressed to pub-submit@ams.org. Include them as attachments, not as part of the message.

The subject line of the message should use the publication code to identify the monograph series (see the list of *The AMS monograph series*, page 5), and should include the name(s) of the author(s). By including this information in the subject line, you will help speed up the processing of your submission.

Submissions received through email will be acknowledged upon receipt by an automatic reply while your submission is reviewed. If there are any problems with the file received, you will be notified.

4. Other possibilities

If your attempt to submit both through the web server and by electronic mail fails, arrangements can be made for you to post your files via FTP or on physical media. Requests for help can be addressed as described in the section "Getting help: AMS resources" on page 31.

CHAPTER 5

Resources and getting help

1. Getting help: AMS resources

Many questions raised by authors are answered in the AMS Author FAQ [FAQ]. Please check there before asking for assistance.

If you encounter difficulties in preparing or submitting your manuscript in electronic form after it has been accepted for publication by the appropriate editorial board, you can ask for help from AMS Technical Support:

Publications Technical Group

Phone: 800-321-4267, ext. 4080 or 401-455-4080

Email: tech-support@ams.org

All written correspondence should be sent to the appropriate AMS department at:

American Mathematical Society 201 Charles Street Providence, RI 02904-2294 USA

or by FAX to 401-331-3842.

For books, questions concerning what you need to prepare your manuscript should be directed to:

Acquisitions Department

Phone: 800-321-4267, ext. 4051 or 401-455-4051

Email: acquisitions@ams.org

Problems in accessing the web server should be reported to:

Email: webmaster@ams.org

2. TeX resources

 \LaTeX and \TeX are available on the web free of charge. There are also several commercial \TeX implementations. AMS web pages devoted to \TeX information can be accessed at www.ams.org/tex. The first of these pages has links to other pages that identify the various sources for the \TeX program.

IATEX is the most popular of the free front ends designed for use with TEX, the basic typesetting program. Whereas plain TEX defines basic macros, IATEX defines stylistic packages, setting up styles for a monograph, journal article, and article in a proceedings collection, which you can then alter to your own specifications.

 $\mathcal{A}_{\mathcal{M}}S$ -IATEX is a collection of IATEX extensions that make various kinds of mathematical constructions easier to produce, and take more care with certain finer

details in order to yield publication-quality results. For $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ -IATEX there are companion design setup packages (variously referred to as 'document class' or 'class' files) that enable authors writing a monograph or article to get largely the same visual appearance in their preliminary drafts as in a final publication with the AMS. $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ -IATEX files are included in the canonical IATEX distribution; updates can be obtained directly from the AMS web server or from CTAN.

The book *More Math into LATEX* [Gr] is written from the point of view of a mathematician using $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ -LATEX, and contains many examples. The *Guide to LATEX*, fourth edition [KD], is a good general introduction to LATEX. The original and authoritative manual for LATEX is the LATEX User's Guide & Reference Manual [La]. George Grätzer has also written a series of articles for *Notices of the AMS* [Gr1, Gr2, Gr3, Gr4, Gr5, Gr6] that keeps the interested user up-to-date with the latest developments in LATEX.

 $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ -IATEX is available from the AMS web server at www.ams.org/tex. Distributions of $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ -IATEX and AMSFonts each include a copy of the relevant User's Guide and related documentation. Each guide provides important information including installation procedures and coding examples. An electronic version of each of these guides is available as part of the distribution packages on the AMS web server.

Another source of information on TeX and LATeX is the TeX Users Group (TUG). They can be contacted at:

TEX Users Group P.O. Box 2311 Portland, OR 97208-2311 (503) 223-9994, FAX: (206) 203-3960 office@tug.org

TUG also distributes the TEX Live collection, which includes ready-to-run implementations of TEX for Windows, Mac, and Unix platforms, as well as LATEX and an extensive selection of packages, all freeware.

3. Online assistance

One of the best places to ask for assistance is the group known by the acronym CTT, groups.google.com/forum/comp.text.tex. Most of the people who use CTT are more than willing to answer questions and give advice.

Another online source of assistance is tex.stackexchange.com. This is organized differently from most discussion groups. After signing up, you pose and answer questions. In the process, you gain points which in turn allow you to do more in the group. Be sure to read tex.stackexchange.com/about to get you started.

The AMS is not equipped to handle questions about specific platforms. Links to sites providing such support, as well as addresses for discussion lists and links for on-line forums, are given on this AMS web page:

www.ams.org/tex/additional-sources.
