

Montserrat 101N – Analyzing Environmental Data
Syllabus – Spring 2018

Professor: John Little

Office: Swords Hall 331

Office Phone: (508) 793-2274

Office Hours: M 2-4pm, T 9-11am, W 10-12noon, R 1-3pm, F 10-12noon, and by appointment

Course Homepage: <http://mathcs.holycross.edu/~little/MONT201718/Spring.html>

Natural World Cluster Events

- Visit to the Worcester Art Museum - Thursday, February 15
- Seminar Led by Our Class - Monday, March 12
- Martha Redbone Performance (through ATB) - Tuesday, April 3
- Banquet - May 3

General Description

This course is a part of the Natural World Cluster of the Montserrat program. This means that at various times we will be addressing one or several of the following:

- The general aims of Montserrat – continued development of your thinking, writing, and communication skills, and the connection of living, learning and doing in college education,
- The theme of the Natural World Cluster (see cover page for this syllabus), and
- The specific subject matter of this seminar – mathematical techniques used for modeling and understanding our natural environment.

Some groundrules

Many class meetings will be devoted to discussions, oral presentations, or work in smaller groups, so your active participation will be important for the success of what we do.

- Unless specifically directed otherwise, please *turn off* all cell phones, pagers, I-phones, I-pads, computers and other similar electronic devices for the duration of each class meeting – your full attention will be required.
- No distracting or “provocative” clothing, headgear, or other personal items in class, please.
- In on-campus events, off-campus trips, etc. you are representing this seminar, the Montserrat program, and by extension, Holy Cross in a wider community. Take responsibility and regulate your behavior accordingly.
- In discussions, there may be times that you disagree with Prof. Little or with a classmate. Please feel free to express that and be prepared to say why and back up your ideas. But please keep the conversation civil and respectful.

This seminar

At the start of the second decade of the 21st century, humans are grappling with a number of tough decisions concerning our place in the natural world and the consequences of how we have used various resources and impacted our environment. For instance, if we continue to use fossil fuels to generate energy for our industry and transportation, what effects can we expect to see from the pollution they generate? In particular, is human activity causing long-term changes in the Earth's climate? Are there realistic alternatives to those fuels that would sustainably provide for human society's energy needs and have fewer harmful effects? How do we decide what alternatives make more sense?

Our ability to develop answers to such questions and to understand the political, economic and social issues involved depends on being able to deal with *quantitative information* and infer patterns from data and measurements of the state of the world. This semester, our mathematical study will focus on some basics of *statistics and data analysis*. We will also see ways these topics can be applied to study environmental issues.

More specifically, we will study the following topics:

1. Following up on our elementary modeling from the fall semester, we will begin with a consideration of the “systems” perspective from Donella Meadows’ *Thinking in Systems*. This book is, among other things, a partial antidote to the pessimism that we seemed to have settled into last semester—it shows how understanding the characteristics of various systems can also lead to concrete ideas about how to influence their behavior and change their course when that is necessary
2. After about two weeks, we will move into our major topic for the semester—techniques for analyzing and understanding the patterns present in data. Starting point: Statistics for describing the “shape” of a data set – measures of central tendency such as means and medians, measures of spread such as interquartile ranges, the standard deviation, graphical ways to represent all of this
3. Measurement as sampling from a population, normal and non-normal distributions, parameter estimation
4. Statistical inference techniques – how scientists and statisticians demonstrate evidence for the existence of patterns in populations

We will not make use of any calculus or mathematics more advanced than ideas about functions, graphs, algebra, some geometry, etc. So everyone should have seen all the mathematical prerequisites and some of the basic ideas behind material we study may be familiar from mathematics courses you took in high school. What will probably be different, though, is the consistently applied and environmental focus of everything we do.

Course Objectives

The major objectives of the seminar will be:

1. To introduce the “systems perspective” as a way to formulate and analyze models of the natural world
2. To acquaint you with, and develop your skill in applying, various techniques of data analysis and statistics
3. To study ways that the mathematics from point 1 can be used to address environmental questions.
4. To further your development as speakers and writers.
5. To create a group atmosphere where civil and constructive conversations can take place concerning difficult questions. Many of the topics we discuss will have controversial aspects and reasonable people can have very different viewpoints on them. Recognizing that, everyone (including Prof. Little, of course) should listen carefully and seek to understand where others are coming from, especially when your first inclination might be to disagree. (Good academic *writing* can also be seen as a conversation between the writer and others who have thought about similar questions. So this way of doing things will carry over into the way we approach writing assignments as well.)
6. To participate in and contribute to the common activities of the Natural World Cluster of the Montserrat program.

Texts

The texts for the course are:

- 1) Meadows, D. *Thinking in Systems*, Chelsea Green Publishing, ISBN 978-1-60358-055-7
- 2) Little, J. *Elementary Mathematical Modeling and Data Analysis with Environmental Applications* (new title–newly supplemented) – available from course homepage

Course Schedule

A detailed day-by-day course schedule and listing of required and suggested outside events will be maintained on the course homepage (and will be accessible through the Moodle course management system). That listing is a tentative, evolving schedule, so it may change and you will probably want to refer to it frequently. Any important changes will also be announced in class well in advance.

Assignments and Grading

- 1) *Final exam* – given at regular time for MWF 9am classes, to be announced – 20 % of course grade.
- 2) *Individual problem sets* (about 7 through the semester) – 15 % of course grade
- 3) *Writeups from group project days* (about 3 assignments) – 15 % of course grade
- 4) *Two roughly 3 page papers* (information and guidelines to be distributed later) – 15 % of course grade

- 5) *Midterm Project* – A larger group assignment over the first half of the semester leading to a research paper of about 10 pages, and an oral presentation *to the assembled Natural World Cluster* on the evening of March 12. Breakdown of grading:
- Paper – 20%
 - Presentation – 10%
- 6) *Class participation* – 5 % of course grade

I will be keeping your course average in numerical form throughout the semester, and only converting to a letter for the final course grade. The course grade will be assigned according to the following conversion table (also see Note below):

- A – 94 and above
- A- – 90 - 93
- B+ – 87 - 89
- B – 84 - 86
- B- – 80 - 83
- C+ – 77 - 79
- C – 74 - 76
- C- – 70 - 73
- D+ – 67 - 69
- D – 60 - 66
- F – 59 and below.

Note: Depending on how the class as a whole is doing, some downward adjustments of the above letter grade boundaries may be made. No upward adjustments will be made, however. (This means, for instance, that an 85 course average would never convert to a letter grade of B- or below, although it might be a B+ in some circumstances.) If you ever have a question about the grading policy or your standing in the course, don't hesitate to ask me.

Advice On How To Succeed In This Class

A good “work ethic” is key. As you should be able to tell from the course description above, you do not need to be a “math genius” to do well in this course. But you will need to put in a consistent effort and keep up with the reading and assignments.

Come to class. Unless you are deathly ill, have a genuine family emergency, are away at a game or meet of a college athletic team, etc. plan on showing up here at 9:00 am every Monday, Wednesday, and Friday this semester. Many of the class meetings will be structured around discussions or student presentations. Your participation is expected and needed for the success of the course!

Take notes and use them. This may seem obvious, but it is worth saying! Used intelligently, your notes can be a valuable resource as you work on problem sets and prepare for exams.

Use the texts and class notes actively. Reading about mathematics is not like reading a novel. You will probably need to read and think over things more than once. You may want to work through examples to understand some of the topics that we do.

Set up a regular study schedule and work at a steady pace. It's not easy to play catch-up in a mathematics course (even when the course is part of a first-year program with additional goals beyond the mathematics). You should expect to budget at least 6 hours in a typical week for work outside of class. The best way to use your time is to do a few problems, some reading from the books, and reviewing of class notes every day.

Most importantly, if you are having difficulty learning something, get help as soon as possible. You can do this by asking questions during class (any time something isn't clear), or seeing me during office hours.

Statement on Academic Integrity

All education is a cooperative enterprise between teachers and students. This cooperation works well only when there is trust and mutual respect between everyone involved. To become an engaged and advanced learner, you must be able to think and work both independently and in concert with your peers. The College academic honesty policy states: "As an institution devoted to teaching, learning, and intellectual inquiry, Holy Cross expects all members of the College community to abide by the highest standards of academic integrity. Any violation of academic honesty undermines the student-teacher relationship, thereby wounding the whole community. The principal violations of academic honesty are plagiarism, cheating, and collusion.

Plagiarism is the act of taking the words, ideas, data, illustrative material, or statements of someone else, without full and proper acknowledgment, and presenting them as one's own.

Cheating is the use of improper means or subterfuge to gain credit or advantage. Forms of cheating include the use, attempted use, or improper possession of unauthorized aids in any examination or other academic exercise submitted for evaluation; the fabrication or falsification of data; misrepresentation of academic or extracurricular credentials; and deceitful performance on placement examinations. It is also cheating to submit the same work for credit in more than one course, except as authorized in advance by the course instructors.

Collusion is assisting or attempting to assist another student in an act of academic dishonesty."

The full statement on Academic Integrity in the College Catalog is available at

https://www.holycross.edu/sites/default/files/files/registrar/academic_integrity_policy_0.pdf

The temptation to engage in an act of academic dishonesty will almost certainly arise, but the chance to possibly enhance a single grade is not worth the loss of your personal integrity. NOTE: If in doubt about what you plan to do or write violates academic honesty policy, please ask Prof. Little for guidance before acting.

Specific Guidelines for this Course

In this course, the final examination will be closed-book. No sharing of information with other students in any form will be permitted during that. On group discussion write-ups, close collaboration with the other members of your group is expected. On the individual problem sets, discussion of the questions with other students in the class and with me during office hours is allowed, *even encouraged*. However, your final problem solutions should be prepared individually and the wording and organization of your final problem solutions should be entirely your own work. Moreover, if you do take advantage of any of the above options for discussion of problems with others, you will be required to state that fact in a footnote accompanying the problem solution. Failure to follow this rule will be treated as a violation of the College's Academic Integrity policy. For the papers, if you do consult a source other than the course texts, include a full reference in a bibliography section at the end of your paper, and identify any direct quotations. Information about the acceptable formats for doing this will be distributed with the paper assignments.

Policy on Excused Absences

This is available at:

http://www.holycross.edu/sites/default/files/files/registrar/excused_absence_policy.pdf

Disability Statement

Any student who feels the need for accommodation based on the impact of a disability should contact the Office of Disability Services to discuss support services available. Once the office receives documentation supporting the request for accommodation, the student would meet privately with Disability Services to discuss reasonable and appropriate accommodations. The office can be reached by calling 508-793-3693 or by visiting Hogan Campus Center, room 215A.

Statement on Diversity and Inclusion

It is my intent that students from all diverse backgrounds and perspectives be well-served by this course, that students' learning needs be addressed both in and out of class, and that the diversity that the students bring to this class be viewed as a resource, strength and benefit. It is my intent to present materials and activities that are respectful of diversity: gender identity, sexuality, disability, age, socioeconomic status, ethnicity, race, nationality, religion, and culture. Your suggestions are encouraged and appreciated. Please let me know ways to improve the effectiveness of the course for you personally, or for other students or student groups.
