I. From Abbott: 4.4.2, 4.5.2, 4.5.3, 4.5.7, 5.2.3, 5.2.4.

Additional Problems

II.

- A) Show that if f(x) is any polynomial of *odd* degree, then f has a real root (that is a real number c where f(c) = 0).
- B) Suppose that f(x) is a polynomial of *even* degree and that there exist $a \neq b$ in **R** such that f(a) < 0 < f(b). Show that f has at least two distinct real roots.
- C) True or False: Any polynomial of even degree with a real root has at least two distinct real roots.
- III. Show that the equation $x^2 = 3^x$ has at least one real solution.

IV.

- A) Suppose f is continuous on [0, 1] with f(0) < 0 and f(1) > 1. Prove that there is at least one point $c \in (0, 1)$ where $f(c) = c^2$.
- B) Generalize your reasoning from part A to show that if f is as before and g is any continuous function on [0, 1] with $g(0) \ge 0$, $g(1) \le 1$, the there is at least one point $c \in (0, 1)$ where f(c) = g(c).
