

Mathematics 242 – Principles of Analysis  
Problem Set 5  
**Due:** March 14, 2014

*'A' Section*

1. For each of the following sequences, determine three different subsequences, each converging to a different limit. For each one, express your three subsequences as  $x_{n_k}$  for a suitably chosen (strictly increasing) index sequence  $n_k$ , and give an explicit formula for  $n_k$  as a function of  $k$ :

- (a)  $x_n = \sin\left(\frac{n\pi}{2}\right)$
- (b)  $x_n = \frac{n}{5} - \left[\frac{n}{5}\right]$  (as usual,  $[ \ ]$  denotes the greatest integer function)

2. Let  $x_n = \sqrt{n}$ . For each of the following sequences, either express that sequence as a subsequence of the sequence  $x_n$  for some explicit (strictly increasing) index sequence  $n_k$ , or say why that is impossible:

- (a)  $\{2, 3, 4, 5, \dots\}$
- (b)  $\{\sqrt{3}, \sqrt{6}, \sqrt{9}, \sqrt{12}, \dots\}$
- (c)  $\{1, 2, 4, 8, 16, 32, \dots\}$

3. Let  $x_n = \sin\left(\frac{n\pi}{4}\right)$  and  $y_n = \cos\left(\frac{n\pi}{4}\right)$ .

- (a) Find a (strictly increasing) index sequence  $n_k$  such that both  $x_{n_k}$  and  $y_{n_k}$  converge.
- (b) Find a second (strictly increasing) index sequence  $n_k$  such that both  $x_{n_k}$  and  $y_{n_k}$  diverge.
- (c) Find a third (strictly increasing) index sequence  $n_k$  such that one of  $x_{n_k}$  and  $y_{n_k}$  converges and the other diverges.

*'B' Section*

1. (True or False) – If the statement is true give a proof; if it is false give a counterexample.

- (a) If  $x_n$  is a sequence of strictly positive numbers converging to 0, then  $x_n$  has a strictly decreasing subsequence  $x_{n_k}$ .
- (b) If  $x_n \rightarrow 0$ , then  $x_n$  contains a strictly increasing subsequence or a strictly decreasing subsequence (or both).
- (c) If  $x_n$  is a monotone increasing sequence with a bounded subsequence  $x_{n_k}$ , then  $x_n$  converges.

2. Consider the sequence  $x_n = \cos(n)$  (where we think of  $n$  as an angle expressed in radians).

- (a) Prove that  $x_n$  has a convergent subsequence.

- (b) In this part of the question we will show that  $x_n$  is not convergent, though. Suppose  $\lim_{n \rightarrow \infty} \cos(n) = a$  for some real number  $a$ . Using a trig identity for  $\cos(n + 1)$  and considering  $\lim_{n \rightarrow \infty} (\cos(n + 1) - \cos(n))$ , show that

$$\frac{a(\cos(1) - 1)}{\sin(1)} = \lim_{n \rightarrow \infty} \sin(n).$$

But then use the sequence  $\lim_{n \rightarrow \infty} (\sin(n + 1) - \sin(n))$  to deduce that  $a = 0$ , so  $\lim_{n \rightarrow \infty} \cos(n) = \lim_{n \rightarrow \infty} \sin(n) = 0$ . But this is a contradiction. Explain why to conclude the proof.

3. A *cluster point* of a sequence  $x_n$  is a limit of a convergent subsequence  $x_{n_k}$ . (See question 1 on the A section for examples of sequences with several different cluster points.) Show that if  $a_m$  is a convergent sequence of cluster points of a given sequence  $x_n$ , then  $a = \lim_{m \rightarrow \infty} a_m$  is also a cluster point of the  $x_n$  sequence.
